

Apollo Explorer

Network centric user interface for wall management

Control room display walls may have multiple users while displaying and controlling many applications.

They are often used in dynamically changing environments. APOLLO features the APOLLO EXPLORER to successfully manage all this, whether it functions as an operation or administration tool.

The APOLLO EXPLORER bundles all the functionalities provided by the Device Manager, the Remote Desktop and the Layout Selector into one coherent interface. Although these functions are integrated into the EXPLORER they can still be launched as stand-alone programs. This approach is generally used to limit the available system functionality towards control room operators.

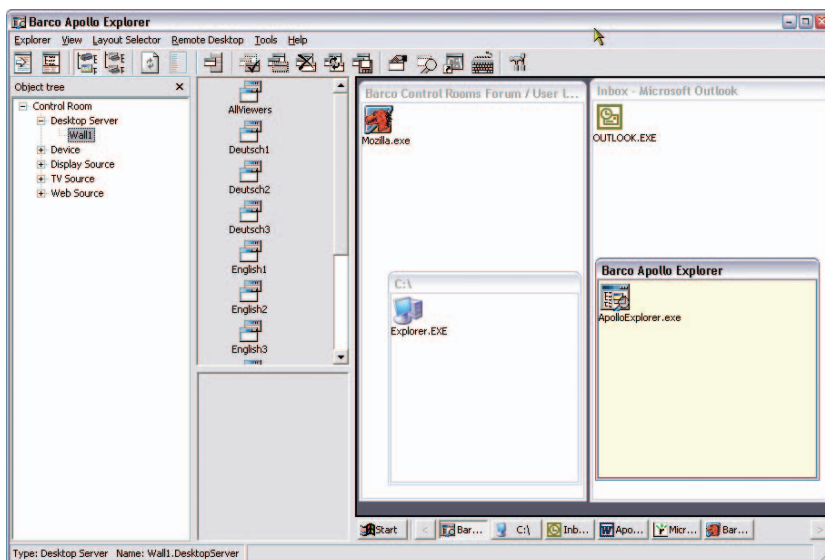

The Explorer offers:

- Overview and control of complete display systems within a single coherent user interface
- Network centred remote control & administration for one or more control room displays
- Status checking of all devices connected to your display wall system
- Control devices like matrix switchers or projectors
- Select and control a desktop of a display wall
- Select, load, unload and save layouts
- Switching of sources in Viewers through Drag & Drop functionality
- Manipulate application windows on a display wall
- Administration of user permissions
- Full support for Context Menus. Right clicking on an object shows relevant controls and information
- Commands can be added to Context Menus for improved usability
